

ABSTRACT

Apparatus and method for providing application specific multi-dimensional information to an application running on a user computing device, wherein at least one dimension of the information is a category, from a plurality of member documents electronically extracted from a library of electronically searchable documents, may comprise an application specific multidimensional information extractor to extract occurrences of prospective representations of dimensions of application specific multidimensional information and to extract occurrences of non-application specific multidimensional information; and, an encoder adapted to encode the occurrences of prospective dimensions of application specific multidimensional information and non-application specific multidimensional information contained in member documents according to a dimension specific coded representation of each dimension of application specific multidimensional information and a non-application specific coded representation of each non-application specific multidimensional information element. There can be a member document identifier to determine whether a member document contains coded formatting, and if not, whether the member document is a dense document, and if not, for rejecting the document from further processing, and the coded formatting may comprise network markup language coding. There may be an application specific multidimensional information verification unit to verify the extraction of application specific multi-dimensional information from the member documents, and a database for storing the application specific multi-dimensional information adapted to provide an application running on a user computing device access to the application specific multidimensional information. The information may be scheduled events having the dimensions of time, location and event identity, and the application can be an electronic calendar or other similar scheduling software program.
